

The Google DNS server was by far the fastest on average for DNS Resolution. The local DNS server competes very well with the Google DNS server however sometimes it may take longer than average. I noticed that for websites based in Asian countries (such a baidu and jd), the local DNS resolution time was extremely variable. Sometimes I got a query time of 15ms and sometimes it would be >2000ms. As expected, my resolver ended up taken the most time.
